

Continental air masses, designated by the lowercase letter "c", originate over continents and are therefore dry air masses. Maritime air masses, designated by the letter "m", originate over ...

The air masses present over North America and the surrounding ocean areas include marine polar (mP), continental polar (cP), continental Arctic (cA), marine tropical (mT), and continental tropical (cT).

Colder air masses are termed polar or arctic, while warmer air masses are deemed tropical. Continental and superior air masses are dry, while maritime and monsoon air masses are moist. Weather fronts ...

Arctic air masses are even colder and drier than Polar air masses, and Antarctic air masses are even more extreme than Arctic air masses. The common types of air masses are maritime Tropical (mT), ...

11.2.2 Air Mass Modification As these air masses move around the Earth, they can begin to acquire different attributes. For example, in winter, an arctic air mass (very cold and dry air) can move over ...

An air mass is a large mass of air that has similar characteristics of temperature and humidity within it. An air mass acquires these characteristics above an area of land or water known as its source region.

Six types of global air masses cover the Earth's surface and impact the weather patterns of individual regions. We take a closer look at each one and its main characteristics. At any given time, all regions ...

Air masses (not seasons) determine weather conditions. Discover five kinds of air masses and their source regions.

Study with Quizlet and memorize flashcards containing terms like Continental tropical, Maritime tropical, Maritime polar and more.

OverviewClassification and notationCharacteristicsMovement and frontsModificationIn meteorology, an air mass is a volume of air defined by its temperature and humidity. Air masses cover many hundreds or thousands of square miles, and adapt to the characteristics of the surface below them. They are classified according to latitude and their continental or maritime source regions. Colder air masses are termed polar or arctic, while warmer air masses are deemed tropical. Continental and superior air masses are dry, while maritime and monsoon air masses are moist. Weather fronts separat...

Meteorologists identify air masses according to where they form over Earth. There are four categories for air masses: arctic, tropical, polar and equatorial. Arctic air masses form in the ...
