The P0127 code stands for "Intake Air Temperature Too High," which means the air temperature is higher than expected based on the sensor input. Some of the possible causes of the P0127 code include intake air ...

The air-cooled diesel generator also needs to check if the air deflector and cover are damaged, as damage can cause hot air to circulate to the air inlet, affecting the cooling effect.

This paper aims at differentiating between the ambient temperature vs. air-on-core (AOC) method of rating the performance of a cooling system used on a generator set.

One important reason for this is that if the combustion air intake temperatures get too high, the generator engine will derate and the generator will not be able to output rated power.

In this method of cooling, inlet air to the compressor is cooled from ambient temperature to a lower temperature by means of an "ammonia-water" vapor absorption ...

Over-sized radiators / fin-fan banks mounted externally to the generator room, and a howling gale of cooling air through the engine enclosure to handle the heat rejection from the engine itself.

High air inlet temperature of air-cooled generator

The installer must make sure that the total square inches of free air inlet opening is sufficient to limit the heat rise in the room to prevent the room temperature from exceeding the generator 's operating temperature.
