District heating is an underground infrastructure asset where thermal energy is provided to multiple buildings from a central energy plant or plants. Steam or hot water produced at the plant is ...

Avec les beaux jours, vous vous préoccupez moins de savoir com-bien va vous coûter votre chauff-fage ou votre éclairage. Mais chez Sibelga, on s'en soucie toute l'année. Du moins pour la partie qui nous ...

How does district heating work? The term "economies of scale" often pops up in discussions about energy. Which raises the following question: what is cheaper and less polluting? Two hundred small ...

But what exactly is district heating, how does it work technically, and why are more and more municipalities, businesses and households choosing it? ...

How does a carbon monoxide detector work? A CO detector continuously measures the concentration of carbon monoxide in the air. When the amount of CO reaches a dangerous threshold, it often starts ...

District heating is a centralized energy system that delivers thermal energy in the form of hot water or steam through a network of insulated pipes to multiple ...

For economic and environmental reasons, gradually switching from natural gas heating to renewable sources makes sense! The process is simple.

How does district heating work? Through a district heating network, the heat-producing plant pumps heated supply water to consumers where it is used as ...

How does a heat exchanger work? Heat exchangers are essential but often overlooked devices that play a crucial role in our daily lives. Hybrid heat pumps: a good alternative for more sustainable heating? ...
