

What percentage of Netherland's energy consumption is renewable?

In 2023, the share of renewables in the Netherland's gross final energy consumption reached 17.4 percent, below the EU average of 24.6 percent. [Log in or register to access full data.](#)

Will the Netherlands be able to produce electricity from wind and solar?

The country could fall short of its obligations to produce electricity from wind and solar power as early as 2030, raising both financial and energy security concerns. The Netherlands Environmental Assessment Agency (PBL) predicts that by 2030, only 32 percent of Dutch electricity will come from renewable sources, below the EU target of 39 percent.

What are the main sources of energy in the Netherlands?

Wind will be the biggest source of energy. The Netherlands' location on the North Sea makes it convenient to generate energy offshore. Because wind turbines at sea can't produce enough energy on their own, wind turbines and wind farms on land will also provide a significant amount. Solar power is another major source of clean energy.

How much energy does the Netherlands produce in 2022?

Hydropower, nuclear energy and geothermal energy (heat from deeper than 500m) contribute a limited volume to Dutch energy production: in 2022, nuclear energy produced 4 TWh electricity, hydropower generated 0.05 TWh electricity, and geothermal heat produced 1.7 TWh in heat.

The renewable energy landscape in the Netherlands continues to evolve rapidly. From a legislative point of view, a new Energy Act will enter into force on 1 January 2026.

For the first time, in 2024, more than half of the electricity produced in the Netherlands came from renewable sources, and almost all of it (45%) from solar and wind.

The Netherlands risks losing billions of euros if it fails to meet European Union renewable energy targets. The country could fall short of its obligations to produce electricity from wind and ...

The Netherlands plays an important role in Europe as a hub for global energy trade, through its open market and integrated supply chains. However, the outlook for Europe's second ...

By 2050, the Netherlands wants to be using energy from sustainable sources only. There's a long way to go before this can happen. It will require new wind farms, electricity pylons, cables and other ...

In the Netherlands, household consumers can choose to buy renewable electricity. The relative amount of renewable energy used by household users has been steadily increasing, rising from 38% in 2008 ...

Nearly half the electricity produced in the Netherlands is now renewable In 2023, 48 percent of electricity was generated from renewable sources such as solar, wind and water. Between ...

The Dutch share of renewable energy is historically substantially lower than the EU average (see graph). Renewable energy consumption rose from 277 PJ in 2022 to 308 PJ in 2023. ...

Over the last decade, renewable energy consumption has increased considerably in the Netherlands. From 2010 to 2022, the gross inland consumption of renewables more than doubled, ...

Renewable energy sources, such as solar energy, wind energy, hydropower, geothermal energy, nuclear energy and biomass, are inexhaustible and form the basis of a sustainable energy ...
