What makes a building earthquake resistant?

Earthquake-resistant designs typically incorporate ductility (the ability of a building to bend, sway, and deform without collapsing) within the structure and its structural members. A ductile building is able to bend and flex when exposed to the horizontal or vertical shear forces of an earthquake.

Does earthquake-resistant design reduce the risk of catastrophic failures?

The use of these systems has significantly regions. The findings underscore that SH M and real- and reduce the risk of catastrophic failures. While in earthquake-resistant design.
