

Slight increase rate of power grid consumption

Explore how renewable energy is reshaping the U.S. electric power sector amid rising demand and policy changes.

U.S. electricity demand is forecast to increase 15.8% by 2029, according to a new report from Grid Strategies. Six regions of the country are driving the growth.

The US power grid is facing critical cross currents. Energy demand is surging - and will continue to do so for an extended period, which will require significant additions to power generation capacity and higher capex in ...

What happened last year in the U.S. electric industry shows how hard it is to increase power supplies without raising emissions.

Our analysis shows that U.S. electricity demand is expected to grow 25% by 2030 and 78% by 2050 from 2023 levels.

More recently, U.S. electricity consumption has increased since a relative low point in 2020. From 2020 through the end of our short-term forecast in 2026, we expect electricity consumption to grow at ...

After a 2.2% increase in 2023, global electricity usage is expected to rise by 3.4% annually over the next three years, propelled by growth in China and other emerging markets.

Global electricity demand is forecast to increase by an average annual 3.3% in 2025 and by 3.7% in 2026, a moderation from 4.4% in 2024 but still some of the highest growth rates observed over the last decade.

Electricity use is forecast to increase even more quickly than peak power demand. By 2030, forecasts indicate that total electricity use will increase by 32%. The higher growth rate for electricity use likely reflects high ...

The overall demand for energy from the electric grid in the United States, also known as "load," is projected to increase 25% by 2030 and 78% by 2050, according to a new report by consulting firm ICF.
