

Here is a map of all utility-scale solar farms in California. Hover over a solar farm to view information on each project like their name, capacity and construction date.

Topped up by batteries charged by excess solar output in the middle of the day, the swell in California's solar-powered electricity supplies has triggered the state's largest-ever...

Want to know the latest statistics about solar energy in California in 2025? See the facts here from original research conducted by the Forbes Home team.

California's solar moment is here--but it's fleeting. With incentives expiring and policy environments shifting, delaying solar means paying more, saving less, and risking grid reliability.

Solar power has been growing rapidly in the U.S. state of California because of high insolation, community support, declining solar costs, and a renewable portfolio standard which requires that ...

It's still early into 2025--and the dead of winter--yet solar is meeting nearly 100% of California's grid demand. Solar energy generation is up 33.5% year over year while gas use is down 28.4%.

The California Independent System Operator (CAISO), the grid operator for most of the state, is increasingly curtailing solar- and wind-powered electricity generation as it balances supply ...

California has over 49,000 MW of installed capacity and solar supplies more than 31 percent of California's electricity today, but it must play a bigger role if the state is to reach climate and energy ...

Over the past year, solar generation surpassed natural gas to become California's leading source of electricity, a milestone expected to persist.

Solar photovoltaic (PV) systems generate electricity by converting sunlight into power. California's sunny climate and flat and open terrain make its projects among the most productive in the country.
