

Are there alternatives to a 'windmill'?

Six imaginative designs are offering alternatives to the tried-and-true "windmill." While large wind developers focus on building taller and more powerful conventional wind turbines, several smaller companies--mostly startups--are creating wind generators with multiple, smaller, and oddly shaped blades. Some turbine designs have no blades at all.

Can a wind generator resemble a tree?

Taking a lesson from nature, New World Wind has created a wind generator resembling a tree. Each leaf--or Aeroleaf--is a small, plastic vertical-axis turbine with a microgenerator containing permanent magnets. Designed for microgrids, it can work with AC or adapt to DC. Aeroleaf's tree-like wind device.

Can wind power be used in a microgrid?

Companies like Airloom successfully harvest wind energy with less expense, waste, noise, and environmental impact than traditional wind developments. Some turbine designs are suitable for microgrids or other small-scale uses, while a few startups have ambitions to offer grid-scale power.

What are the different types of wind devices?

The wind devices generally fall into two camps: the vertical axis turbine and the passive flow wind device. However, they differ greatly in size, shape, and intended use. The Windcatcher compared to a traditional wind turbine. Image used courtesy of Wind Catching Systems
